

Proactive, Real-Time Pain Management

Managing a patient's pain level is a complex process that requires dedicated time, continuity, bedside manner and constant communication to perform successfully. By receiving better information more consistently from the patient, staff can better manage a patient's pain experience. Phrazer performs this process on its own, proactively and resides with the patient throughout their stay.

Phrazer is set to prompt the patient at preset intervals for a quick pain interview. Phrazer introduces itself the first time a patient interacts and walks the patient through the simple steps to operate. Phrazer will perform this task in any language and without the need of staff to set this process into motion. Staff can focus their attention when and where needed while Phrazer manages the interviewing and associated charting.

If a patient's pain level is changing, Phrazer gathers additional valuable information, i.e. current pain level, duration, location, radiant areas, nausea etc. This **information is then compiled and delivered to the nursing station** in a meaningful manner for staff to respond to patients more effectively. Patients are now prioritized by discomfort levels so staff can react quicker to manage patients' pain earlier in the process.

Phrazer enables your staff to better manage patients' pain levels and track trends system wide. Real-time measures of all patients, departments and floors can be viewed at anytime. As a result, patients have a better experience.
